# UNDERLYING INFLATION DIVERGES AT REGIONAL LEVEL

Consumer price inflation increased by 0.1 percentage points to 0.6 per cent in the year to June 2020, as per data released by the ONS. Our new analysis of 97,101 locally collected goods and services indicates price increases in the clothing and footwear, health, and miscellaneous goods and services categories. Our measure of underlying inflation, which excludes the most extreme price changes, decreased by 0.2 percentage points to 1 per cent in June 2020. The regional figures for underlying inflation continue to show significantly different trends: consumers in London benefitted from a decrease in underlying inflation while Wales saw a third month of underlying inflation above 2 per cent. While this is the first decrease in national underlying inflation since the lockdown, it still remains above its pre-lockdown level and for that reason our forecast suggests headline CPI inflation above 2 per cent in the 12 months to June 2021.

### **Main points**

- Underlying inflation decreased by 0.2 percentage points to 1 per cent in the year to June 2020, as measured by the trimmed mean, which excludes 5 per cent of the highest and lowest price changes (figure 1).
- At the regional level, underlying inflation was highest in Wales at 2.2 per cent and lowest in London which saw a reduction of 0.1 per cent in the year to June 2020 (table 1).
- 21.6 per cent of goods and services prices changed in June, implying an average duration of prices of 4.6 months. 6.5 per cent of prices were reduced due to sales, 4.7 per cent fell for other reasons and 10.4 per cent were increases (figure 2).
- The historical relationship between current trimmed mean inflation and future CPI inflation implies CPI inflation above 2 per cent in the year to June 2021.

"Headline CPI inflation increased to 0.6 per cent in the year to June 2020, up from 0.5 per cent recorded in May. Our analysis of approximately 97,000 goods and services included in the basket indicates higher prices in the clothing and footwear, health, and miscellaneous goods and services categories. Our measure of underlying inflation, which excludes extreme price movements, decreased to 1 per cent in June. On this basis, we expect CPI inflation to settle slightly above the Bank of England's target of 2 per cent in the coming year."

#### **Measuring Real Consumption and CPI Bias under Lockdown Conditions**

The coronavirus pandemic and the associated lockdown imposed on the 23<sup>rd</sup> of March meant that many goods and services were unavailable to consumers in the UK. This has undoubtedly had a drastic impact on the production of economic statistics, such as the Consumer Price Inflation (CPI). The sudden onset and unprecedented nature of the shock meant that the ONS did not have the time to develop methods to address changes to price collection methods<sup>1</sup> and consumption expenditure patterns.

Research conducted by <u>Diewert and Fox</u> (2020) indicates that using standard methodology to compute consumer inflation could result in downward bias in the CPI and upward bias in real consumption. Their paper suggests producing a special revisable analytic CPI, using information from a continuous consumer expenditure survey, that supplements the existing CPI. This month the ONS have published an <u>Alternative CPI</u> based on a consumer price basket that has been rescaled to remove items unavailable due to the coronavirus pandemic.

In addition to this document that analyses price quote data released by the ONS, NIESR also publishes a <u>Lockdown CPI</u> based on alternative expenditure weights.

-

<sup>&</sup>lt;sup>1</sup> The ONS have published <u>Coronavirus and the effects on UK prices</u> which details their plans for data collection, compilation and publication of price statistics.

-2

This analysis builds on the work presented in the <u>National Institute Economic Review</u>, which constructs a measure of trimmed mean inflation based on the goods and services prices that underlie the consumer price index.

Our next analysis of consumer prices will be published on 19 August.

**CPI** inflation

Figure 2 – CPI and trimmed mean inflation (per cent)

Note: Our measure of trimmed mean inflation excludes 5 per cent of the highest and lowest price changes. The level of trimmed mean inflation is typically lower than CPI inflation due to differences in how the largest price changes are treated and to how the prices are weighted.
